

# Are string inverters suitable for large-scale solar container

<div class="df\_qntext">Can string inverters be used in large-scale PV systems?

When considering large-scale PV systems, a basic distinction is made between two system concepts: those in which string inverters are used and those that favour a central inverter. The following sections look at the broad operational capability of string inverters and consider their application potential in large-scale commercial systems.

<div class="df\_qntext">Should you put a string inverter under a solar module?

String inverters have an advantage over central inverters in that they are both more compact and lighter, so simply putting them underneath the solar modules will provide adequate levels of shading. With every PV system, it is essential to consider the distances between the module array and the main distributor in advance.

<div class="df\_qntext">What are the different types of PV inverters?

There are three primary tiers of PV inverters: microinverters, string inverters, and central inverters. Since microinverters are not rated for utility-scale voltages, we will largely ignore them in this article. String inverters convert DC power from "strings" of PV modules to AC and are designed to be modular and scalable.

<div class="df\_qntext">Can a System Planner design a string inverter?

For example, the system planner can design the bulk of the system to use string inverters equipped with 1 MPP tracker, while reverting to a string inverter with multiple MPP trackers for complex or shorter strings.

<div class="df\_qntext">Are string inverters reliable?

The dependability of the yield of a PV system utilising string inverters is guaranteed by two important factors. Firstly, the string inverter concept increases supply reliability, as only a small part of the system is affected by a failure (e.g. 27 kW in the case of the Fronius Eco).

<div class="df\_qntext">What is a microinverter & a string inverter?

Microinverters and other module-level power electronics can be found on residential rooftops as well as commercial systems. Central inverters are installed in large commercial and utility-scale systems. String inverters are designed for all system sizes. Central inverters are large -- in the 1-5 MW range per unit.
