<div class="df\_qntext">What is the total capacity of pumped storage unit?

In order to supplement the pumping and regulating capacity of cascade small hydropower plants, the capacity of the installed pumped storage unit must be no less than the total regulation capacity. Therefore, the total capacity of the pumped storage unit installed at Hydropower Station No. 6 is 16 MW. 6.2. Wind and PV Capacity Configuration Results

<div class="df\_qntext">How can ml be used to estimate reservoir capacity?

The impoundment, operation, and storage of water resources in reservoirs show regional characteristics corresponding to the natural environments (Fig. 3). When ML is used to build a storage capacity estimation model, we need to derive the variables in terms of topography, climate and basin that potentially influence the reservoir capacity.

<div class="df\_qntext">What is a pre-dam water level-storage capacity coefficient?

The pre-dam water level-storage capacity coefficient of the reservoir is a constant,  $a_i$ ,  $i = 0, 1, 2$ , which is typically fitted using the corresponding data of actual hydropower station water levels and storage capacities.

<div class="df\_qntext">What is the space-depth ratio of a pumped storage power station?

Under normal conditions, the space-depth ratio of a pure pumped storage power station is generally not more than 12. Due to the limitation of the lower water head, the space-depth ratio of cascade small hydropower stations is slightly larger than that of pure pumped storage power stations.

<div class="df\_qntext">What is storage capacity estimation model?

Storage capacity estimation model is developed for national reservoirs in China. Different statistical and machine learning models are compared and evaluated. Storage capacity of all unrecorded Chinese reservoirs is estimated. The spatial characteristics of reservoirs number and storage capacity are analyzed.

<div class="df\_qntext">Which reservoir capacity is best for Cascade small hydropower?

The No. 10 reservoir capacity is the largest in the basin, which meets the requirements of the lower reservoir water storage, and both No. 6 and No. 10 have regulated storage capacity, so the "integrated combination" method is used to carry out pumped storage transformation of cascade small hydropower.

energy storage parameters are shown in Table 2. Among them, the units of  $k_1$ ,  $k_2$ , and  $k_3$  are yuan& #183; (MW)<sup>-1</sup> and yuan& #183; (MWh)<sup>-1</sup>, respectively. The discount rate  $l$  is 6%, and the initial ...
