

What is the energy tariff analysis for 2025 to 2045?

Keywords

<div class="df_qntext">Can photovoltaic and battery energy storage systems be deployed behind the meter?

This study investigates the feasibility and optimal sizing of photovoltaic (PV) and battery energy storage systems (BESS) to be deployed behind the meter of a Medium Voltage (MV) industrial consumer.

<div class="df_qntext">Can a shipping container building be adapted for off-grid operation?

This article presents solutions for improved energy efficiency by adapting a shipping container building in Shanghai for off-grid operation. While this prototype is based on a single unit, larger buildings made from multiple units constructed at factories is the ultimate goal.

<div class="df_qntext">What is the energy tariff analysis for 2025 to 2045?

The analysis spans the period from 2025 to 2045, incorporating long term projections of electricity market prices and PV and BESS technology costs. Various energy tariff structures are assessed, including dynamic and static tariffs for grid energy, as well as net-billing (NB) and zero feed-in (ZFI) schemes.

<div class="df_qntext">How can a container unit save energy in winter?

Vacuum Insulation Panels reduced the heat load of a container unit in winter by 40 %. Upgrading to 3-layer glazed windows or reducing the window area is recommended. Natural ventilation uses 7 % more energy than forced ventilation with heat recovery. Relaxed cooling and heating setpoints outside operation provide over 40 % savings.

<div class="df_qntext">How much heat transfer resistance does a container building wall have?

In this study, the heat transfer resistance of a typical container building wall has been improved from 1.0 m² K/W to around 3.7 m² K/W by installing Vacuum Insulation Panels (VIP), verified through measurements. VIPs reduce the temperature dependence of the heating need and the thermal bridges from the steel beams.
