

# How to debug the solar container cabinet

<div class="df\_qntext">How hard is it to debug containers in Kubernetes?

Debugging even simple containerized applications is challenging. Debugging applications that run in distroless containers is hard. And debugging distroless containers running in a Kubernetes cluster is close to impossible. Unless you know a trick a two.

<div class="df\_qntext">What can I do with a container & Kubernetes tool?

With this tool you can: Troubleshoot containers and pods lacking shell and/or debugging tools. Forward unpublished or even localhost ports to your host system. Expose endpoints from the host system to containers & Kubernetes networks. Handily export image's and/or container's filesystem to local folders.

<div class="df\_qntext">What is containerd & how does it work?

containerd is a high-level container runtime, aka container manager. To put it simply, it's a daemon that manages the complete container lifecycle on a single host: creates, starts, stops containers, pulls and stores images, configures mounts, networking, etc. containerd is designed to be easily embeddable into larger systems.

<div class="df\_qntext">How do you debug a docker container?

You point the tool at a running container, say what toolkit image to use, and it starts a debugging &quot;sidecar&quot; container that feels like a docker exec session to the target container: The root filesystem of the debugger is the root filesystem of the target container. The target container isn't recreated and/or restarted.
