<div class="df_qntext">Can a grid-connected solar photovoltaic system participate in primary frequency regulation?

Conclusion This paper proposes a fuzzy-based control strategy for the grid-connected solar photovoltaic system to participate in primary frequency regulation without any energy storage support. A combined fuzzy based de-load control and control mode selector was proposed to enable PV operation at a scheduled level of power reserve.

<div class="df_qntext">Is reactive power control a new frequency regulation approach for solar-PV systems? In this paper, a new frequency regulation approach is proposed based on reactive-power control (i.e., frequency regulation via reactive-power control (FRQC) scheme) for solar-PV systems, which manipulates the active power demand as a function of the system frequency deviation by varying network voltages via reactive power control.

<div class="df_qntext">What is reactive power control (frqc) in solar-PV plants?

This paper proposes a new approach for frequency regulation (frequency regulation via reactive-power control (FRQC)) using solar-PV plants. The proposed FRQC scheme offers further benefits, since it does not require either additional hardware or active power curtailment to provide frequency support. This paper makes the following contributions:

<div class="df_qntext">Can energy storage control system frequency response of noninertial renewable sources?

The author in developed a supervision algorithm to control the energy storages for mitigating the impact of noninertial renewable sources on system frequency response. The BESS act as fast-acting synthetic inertia, they have shown improved PFR.

<div class="df_qntext">Can frqc improve the frequency stability of solar-PV systems?

In this paper, a novel FRQC scheme was proposed for solar-PV systems to enhance the frequency stability of the power grids.

<div class="df_qntext">How to extend the service of PV to secondary frequency regulation?

To extend the service of PV to secondary frequency regulation it needs to be de-loaded for a longer period of time this may reduce the utilization factor of the plant. In summary, the inertial response from PV provides sufficient time for the governor control to take over the action.
