<div class="df_qntext">Are inorganic phase change materials suitable for building integration?

Summary and conclusions In this review work, inorganic phase change materials (iPCMs) have been discussed with their properties and key performance indicators for building integration. The selection of these iPCMs mainly depends on thermophysical properties, mechanical properties soundness during phase transition and compatibility.

<div class="df_qntext">Can inorganic PCM be used in a photovoltaic façade system?

Additionally, the effects of binary mixtures of inorganic PCM were investigated in this façade system. In Germany , , the temperature-regulating photovoltaic façade panel with phase change material was developed in the structure of mullion and transom façades.

<div class="df_qntext">How can phase change materials help a low carbon/green campaign?

Reutilization of thermal energy according to building demands constitutes an important step in a low carbon/green campaign. Phase change materials (PCMs) can address these problems related to the energy and environment through thermal energy storage(TES),where they can considerably enhance energy efficiency and sustainability.

<div class="df_qntext">What is phase change material encapsulation?

Phase change materials (PCM) possess unavoidable defects, like flammability, low thermal conductivity, subcooling, phase separation, etc. Encapsulation techniques have been adopted to address these challenges.

<div class="df_qntext">Are inorganic phase change materials better than organic?

In general,inorganic phase change materials have double the heat storage capacity per unit volumeas compared with organic materials,which can be seen from the comparison in Table 1. They have a higher thermal conductivity,a higher operating temperatures,and lower cost relative to organic phase change materials .
