This AGC control system is tested under two scenarios: (1) an immediate decrease in generating capacity of closely clustered solar power plants; (2) the forced shutdown of a critical traditional generator during the frequency adjustment process due to an operational issue. The contributions of this research include:

<div class="df_qntext">What is automatic generation control (AGC) in a two-area power system?

Therefore, this paper builds an automatic generation control (AGC) system for a two-area power system with high penetration of RESs. This AGC system model aims to maintain system frequency stability amid unpredictable changes in RESs while also ensuring that tie-lines transmit the predetermined power levels to mitigate frequent congestion.

<div class="df_qntext">Does a generator need an AGC system?

A traditional generator with fast response capabilities, such as hydro power, needs to be connected to this AGC system to take on the role of frequency regulation. The frequency of the electrical system is controlled by the AGC system through two control loops--the primary and secondary loops, respectively.

<div class="df_qntext">What is a double-layer automatic generation control (AGC) frequency regulation control method?

Aiming at the problem of power grid frequency regulation caused by the large-scale grid connection of new energy, this paper proposes a double-layer automatic generation control (AGC) frequency regulation control method that considers the operating economic cost and the consistency of the state of charge (SOC) of the energy storage.

<div class="df_qntext">What is the purpose of AGC frequency regulation control?

Objective Function of AGC Frequency Regulation Control: The essence of coordinated control of the joint participation of thermal power units and the energy storage in AGC frequency regulation is to allocate the AGC instructions issued by the dispatching center between the thermal power unit and the energy storage system.

<div class="df_qntext">How does AGC control the frequency of a generator?

The frequency of the electrical system is controlled by the AGC system through two control loops--the primary and secondary loops, respectively. The primary control loop comprises the operation of the governor at generators with droop characteristics to keep the frequency from fluctuating strongly, minimizing the frequency's steady-state error.
