What is a solarsmart 100 boiler?

Alpha's SolarSmart 100, while primarily designed for solar thermal, can be adapted for system boilers with hot water cylinders in solar PV setups. This system simplifies integration by allowing the immersion heater to use solar-generated electricity, maximising energy savings.

Which boiler is best for solar PV?

This setup is ideal for larger homes, as the hot water cylinder allows flexible energy use, complementing the boiler's operation. System and regular boilers are the best match for solar PV due to their hot water cylinder, but combi boilers pose challenges.

Can a system boiler work with a solar thermal system?

System boilers are a brilliant match for solar thermal panels. They're designed to work with a separate hot water cylinder, which can store the hot water generated by your solar thermal system. When the solar-heated water isn't quite hot enough (hello, British weather), the boiler kicks in to top it up.

Are solar panels compatible with a boiler?

Before we get into boiler compatibility, let's clarify the two types of solar panels: Solar Thermal Panels: These heat water directly, feeding it into your hot water system. They're typically paired with a hot water cylinder and are ideal for reducing the demand on your boiler for hot water.

Can a combi boiler work with solar PV?

Combi boilers provide hot water on demand without a cylinder, so they typically don't use an immersion heater. However, some combi models can work with solar PV by powering smart controls, pumps, or ignition systems, indirectly reducing energy costs.
