

# Solar container and heat dissipation capabilities

<div class="df\_qntext">How does solar energy affect the temperature of a container?

At 07:00 AM, the heat energy from solar radiation begins entering the walls. Heat accumulation slowly begins to increase reaching the maximum penetration at 2:00 PM. The effect of heat absorption, at maximum penetration, causes the inner surface of the container walls to increase the temperature by around 4.3°C.

<div class="df\_qntext">Does solar radiation affect the temperature of a container?

The temperature on the wall clearly increases effect from the amount of solar radiation that occurs on the outside of the container. This result proved that wall of the container has been heat penetration from the solar radiation consistent with the results that have been done previously (M.A. Budiyo and Shinoda 2017). Figure 6.

<div class="df\_qntext">Do solar panels absorb heat?

Many natural factors help dissipate the heat from a solar panel, like convection or conduction losses, but if the solar panel is specifically designed to create these convection and conduction phenomena, it can provide better efficiency. Based on this previous conception, some devices are designed for absorbing solar radiation.

<div class="df\_qntext">What are the simulation results of heat accumulation on the container walls?

displays the simulation results of heat accumulation on the container walls. This simulation considers the solar radiation in clear-sky condition, with the constant supply air temperature inside the container at 0°C. At 07:00 AM, the heat energy from solar radiation begins entering the walls.

<div class="df\_qntext">What are solar thermal collectors?

Based on this previous conception, some devices are designed for absorbing solar radiation. Moreover, solar thermal collectors are designed to collect heat by absorbing solar radiation and may be used to heat air or water for several applications. They are one of the renewable energy technologies with the best economics.

<div class="df\_qntext">Does a PV/T air collector improve heat dissipation efficiency?

A novel heat dissipation design integrated into a PV/T air collector is presented. Maximum overall efficiency improvement was 16.53 % compared with a conventional PV/T system. 9E analysis was used as a new methodology to evaluate the PV/T performance.
