<div class="df_qntext">Can SiC composites be used in lithium ion batteries?

The electrochemical performances of SiC composites as anodes for use in lithium-ion (LIBs), sodium-ion (NIBs), zinc-air (ZnBs), and potassium-ion batteries (PIBs) are discussed. The doping effect is comprehensively reviewed, both experimentally and theoretically.

<div class="df_qntext">What is silicon carbide & silicon nanoparticle-decorated carbon (Si/C)?

Silicon carbide (SiC) and silicon nanoparticle-decorated carbon (Si/C) materials are electrodes that can potentially be used in various rechargeable batteries, owing to their inimitable merits, including non-flammability, stability, eco-friendly nature, low cost, outstanding theoretical capacity, and earth abundance.

<div class="df_qntext">Is silicon a good anode material for lithium ion batteries?

Silicon (Si) has been widely investigated as an anode material for lithium-ion batteries (LIBs) due to its high specific capacity of around 4200 mAh/g [1, 2]. However, mechanical failure due to the volume variation during the charging/discharging process restricts its practical applications.

<div class="df_qntext">How can sic and Si/C anodes be enhanced in metal-ion batteries?

The performance of SiC and Si/C anodes in metal-ion batteries can be enhanced significantly via doping SiC with various dopants (i.e., metal, non-metal, and hybrid) and coating with carbon materials (i.e., carbon, graphene, carbon nanotubes) [48,49].
