<div class="df_qntext">How does a brick heating system work?

All around the bricks the wiring that will be heated. After a while, thanks to the solar or wind power plant connected to this unit, the wires become red hot, and the bricks will then store the enormous amounts of heat generated. This heat will be channeled to perform its industrial function.

<div class="df_qntext">Can you make a giant scale heat storage system?

"If you want to make it to giant scale, everybody ought to agree that it's boring and reliable," says John O'Donnell, CEO of California-based heat storage startup Rondo Energy. The startup deployed its first commercial pilot in March at an ethanol plant in California. It's basically a carefully designed stack of bricks.

<div class="df_qntext">Where are polar night energy's heat storage systems located?

Polar Night Energy's heat storage systems are currently installed in the cities of Tampere and Kankaanpää. Big problems demand big solutions, and there is perhaps no bigger 21st-century problem than climate change. To meet this challenge, many governments and organizations are investing in new technology to help lessen the use of fossil fuels.

<div class="df_qntext">What makes SCG refractory brick so special?

As Rondo explains: "SCG's world class refractory production operations are the largest in Southeast Asia. SCG's manufacturing excellence has been recognized by prestigious global quality awards. [...] Refractory brick has been used for centuries for industrial heat storage and is made of Earth's most abundant elements: oxygen, silicon, and aluminum.

<div class="df_qntext">How hot do bricks get?

The insulated steel container housing the bricks can keep them hot for hours or even days. When it's time to use the trapped heat, fans blow air through the bricks. The air can reach temperatures of up to 1,000 °C (1,800 °F) as it travels through the gaps.

<div class="df_qntext">How does a brick oven work?

It's the same mechanism that a toaster uses, O'Donnell says--just a lot bigger and hotter. The heat then radiates through the stack of bricks, warming them up to temperatures that can reach over 1,500 °C (2,700 °F). The insulated steel container housing the bricks can keep them hot for hours or even days.
