<div class="df_qntext">How does a solar storage tank work?

The heat pipes move heat to the solar storage tank, and an internal heat exchanger warms the water in the tank. Cold water is routed directly to the solar storage tank, where it is warmed because of passing through a heat exchanger.

<div class="df_qntext">How does a solar water heater work?

Cold water is routed directly to the solar storage tank, where it is warmed because of passing through a heat exchanger. When hot water is drawn from the system, it is taken from the backup tank, and preheated water from the solar tank goes to the inlet of the backup water heater.

<div class="df_qntext">How does a solar heat pipe work?

As the gas moves to the top of the pipe, it cools and releases the heat of vaporization as it condenses back to a liquid. The liquid runs down the tube, completing the cycle. The outer tube contains a hard vacuum, so it eliminates conduction or convection loss from the gas. Figure 2 Solar Heat Pipe Construction

<div class="df_qntext">Why are solar hot water panels more efficient in cold climates?

Solar hot water heating panels composed of heat tubes are more efficient in cold climates that are flat panels, and they are not affected by outside air temperature or wind because the evacuated glass prevents heat loss by conduction and convection. Figure 3 shows heat pipe collectors for a hot water system in Switzerland, where freezing is common.

<div class="df_qntext">How does a closed loop water heating system work?

In a closed-loop water heating system, potable water is never exposed to the outside environment: A separate loop is used with a fluid that is heated. Generally, this fluid is a propylene-glycol mixture that is heated and sent to a heat exchanger, where the heat is transferred to the potable water.

<div class="df_qntext">How does solar insolation work?

Solar insolation striking the assembly causes the fluid to evaporate easily, and the hot gas moves to the top of the inner copper tube, where the heat is transferred to a heat transfer fluid and eventually to the potable water.
