

Solar container unit debugging fan principle

<div class="df_qntext">What is a solarcontainer?

The Solarcontainer is a photovoltaic power plant that was specially developed as a mobile power generator with collapsible PV modules as a mobile solar system, a grid-independent solution represents. Solar panels lay flat on the ground. This position ensures maximum energy harvest Panels lays flat on the ground.

<div class="df_qntext">How does an inverter cooling fan work?

The fan will then automatically operate to circulate cool air to the inverter's internal components while removing the inverter's hot air. The cooling fan will continue to work until the inverter temperature returns to the normal limit, and stop automatically to save energy.

<div class="df_qntext">How do inverter cooling fans help prevent overheating?

Helps Prevent Overheating: Inverter cooling fans can help to relieve the heat generated by the inverter due to the conversion process that takes place, where this tool serves to ensure that the inverter is at a predetermined normal temperature.

<div class="df_qntext">How many installers does a solarcontainer need?

At least 3-4 installers and 1 crane operator are needed to put the Solarcontainer into operation within one day. How many households can one Solarcontainer supply with electricity?

<div class="df_qntext">How many households can a solar Container Supply?

Based on an average power consumption of a 4-person household of 4000 kWh per year and a location in Southern Germany, the solar container can supply approx. 32 households with climate-friendly electricity. At a location in Southern Europe it can even be up to 50 households due to the high solar radiation.
