<div class="df_qntext">How does a novel battery structure differ from a conventional battery structure?

The flow field, which is usually carved on the bipolar plate in the conventional battery structure, is placed between the electrode and membrane in the novel battery structure. Compared with the original battery structure, the novel battery structure exhibits similar flow characteristics since the flow field is reserved.

<div class="df_qntext">What is a modified battery structure for vanadium redox flow battery?

A modified battery structure for vanadium redox flow battery is proposed. Three-dimensional model is established to evaluate the battery performance. Flow fields between the electrode and membrane is visualized. Modified battery shows higher voltage efficiency with lower pressure drop.

<div class="df_qntext">What are the properties of vanadium flow batteries?

The reaction uses the half-reactions: Other useful properties of vanadium flow batteries are their fast response to changing loads and their overload capacities. They can achieve a response time of under half a millisecond for a 100% load change, and allow overloads of as much as 400% for 10 seconds.

<div class="df_qntext">Can polymeric membranes be used in vanadium redox flow batteries (VRB)?

This review on the various approaches to prepare polymeric membranes for the application in Vanadium Redox Flow Batteries (VRB) reveals various factors which should be considered when developing new membranes materials with or without the addition of non-polymeric materials.

<div class="df_qntext">Why are innovative membranes needed for vanadium redox flow batteries?

Innovative membranes are needed for vanadium redox flow batteries, in order to achieve the required criteria; i) cost reduction, ii) long cycle life, iii) high discharge rates and iv) high current densities. To achieve this, variety of materials were tested and reported in literature. 7.1. Zeolite membranes

<div class="df_qntext">Why does a vanadium electrolyte deteriorate a battery membrane?

Exposure of the polymeric membrane to the highly oxidative and acidic environment of the vanadium electrolyte can result in membrane deterioration. Furthermore, poor membrane selectivity towards vanadium permeability can lead to faster discharge times of the battery. These areas seek room for improvement to increase battery lifetime.
