<div class="df\_qntext">What is a blowout preventer control system accumulator?

The blowout preventer control systems accumulator showing regulator valves, accumulator bottles, back-up pump (pneumatic), hydraulic reservoir, control manifold, control valves, and pump (electric, gas, diesel). The BOP control system, called an accumulator, provides the energy to operate the blowout preventers. This system consists of:

<div class="df\_qntext">What is the control system of a blowout preventer?

The control system of a blowout preventer manages the operation of its components, ensuring proper functionality. It includes hydraulic control panels, accumulators, control valves, and instruments that move the rams and activate the annular preventer.

<div class="df\_qntext">How do blowout preventers work?

BOPs on offshore rigs are mounted below the rig deck. Subsea BOPs are connected to the offshore rig above by a drilling riser that provides a continuous pathway for the drill string and fluids emanating from the wellbore. In effect, a riser extends the wellbore to the rig. Blowout preventers do not always function correctly.

<div class="df\_qntext">What should be included in a blowout preventer control unit?

As a minimum requirement, all blowout preventer control units should be equipped with accumulator bottles with sufficient volumetric capacity to provide the usable fluid volume (with pumps inoperative) to close one pipe BOP ram and the annular preventer in the stack plus the volume to open the hydraulic choke line valve.

<div class="df\_qntext">What is an annular blowout preventer?

Annular BOPs are typically located at the top of a BOP stack, with one or two annular preventers positioned above a series of several ram preventers. An annular blowout preventer uses the principle of a wedge to shut in the wellbore. It has a donut-like rubber seal, known as an elastomeric packing unit, reinforced with steel ribs.

Accumulator bottles are containers that store hydraulic fluid under pressure for use in effecting blowout preventer closure. Through the use of compressed nitrogen gas, these containers store energy which can be used to effect rapid preventer closure. There are two types of BOP accumulator bottles in common usage, separator and float types. The sep...
