<div class="df\_qntext">What is a bi-directional Converter?

AC/DC topologies Bi-directional converters use the same power stage to transfer power in either directions in a power system. Helps reduce peak demand tariff. Reduces load transients. V2G needs "Bi-Directional" Power Flow. Ability to change direction of power transfer quickly. High efficiency >97% (End to End) at power levels up to 22KW.

<div class="df\_qntext">Are bidirectional DC-DC converters suitable for hybrid energy storage system?

Aiming to obtain bidirectional DC-DC converters with wide voltage conversion range suitable for hybrid energy storage system, a review of the research status of non-isolated converters based on impedance networks and isolated converters based on transformer are presented.

<div class="df\_qntext">What is a bidirectional DC-DC converter?

In addition, to realize energy recovery, the bidirectional DC-DC converter is required between the power battery or SC and vehicle bus to realize the flow of feedback energy. Therefore, the bidirectional DC-DC converter is the key component of HESS. It determines the performance of HESS and further affects the performance of the powertrain of NEV.

<div class="df\_qntext">What is a non-isolated bidirectional DC-DC converter?

Non-isolated bidirectional DC-DC converter is an impedance network composed of inductor, capacitor and switch to realize direct DC-DC conversion. A transformer is added between DC and DC in the non-isolated bidirectional DC-DC converter to realize DC-AC-DC voltage conversion.

<div class="df\_qntext">What is the difference between unidirectional and bidirectional DC-DC converter?

The unidirectional DC-DC converter realizes voltage matching and power decoupling between FC and DC bus. The bidirectional DC-DC converter realizes voltage matching between SC and DC bus, and bidirectional flow of instantaneous energy. HESS for PHEV is shown in Fig. 1 (b).

<div class="df\_qntext">What are the problems with bidirectional DC-DC conversion systems for NEV powertrain?

The main issues about bidirectional DC-DC conversion systems for NEV powertrain are as follows: With continuously improved bus voltage levels (400 V promoted to 800 V) of powertrain, a bidirectional DC-DC converter is required to continuously improve the voltage conversion ratio to match the SC (or power battery) and vehicle bus voltages.
